Nama: Siti Aspita Fitri NPM: 22312046

Buat folder create di dalam folder events, dan buat file page.tsx di dalamnya untuk membuat halaman tambah data event.

Buat tampilannya seperti ini.

```
of circles west frequencies test as mo.27

circles west frequency frequency frequency (1)

circles west frequency frequency frequency frequency (1)

circles west frequency frequency frequency frequency (1)

circles west frequency frequency frequency (1)

circles west frequency frequency frequency (1)

circles west frequency
```

Buat file .env di route project dan isikan seperti ini, sebagai default host backend untuk kebutuhan ambil gambar dari backend.

```
NEXT_PUBLIC_API_HOST=http://localhost:3001
```

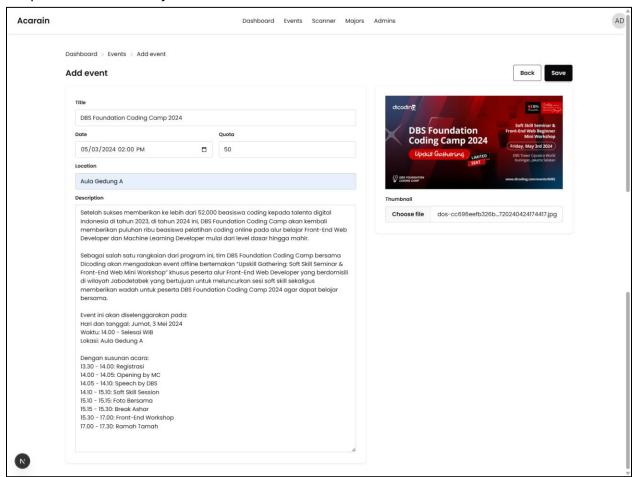

Halaman akan terlihat seperti ini

Buat method untuk handle submit form, untuk handle upload thumbnail juga.

```
const [form, setForm] = useState({
   title: '',
   location: '',
   date: '',
   quota: 0,
   description: '',
   thumbnail: ''
       })
const [error, setError] = useState('')
const [uploading, setUploading] = useState(false)
       const router = useRouter()
       const handleChange = (e: React.ChangeEvent<HTMLInputElement | HTMLTextAreaElement>) => {
    setForm({...form, [e.target.name]: e.target.value})
       const handleUpload = async (e: React.ChangeEvent<HTMLInputElement>) => {
  const file = e.target.files?.[0]
  if (!file) return
               try {
   const data = new FormData()
   data.append('file', file)
                       const res = await axios.post('/upload', data, {
   headers: {
      Authorization: `Bearer ${token}`,
      'Content-Type': 'multipart/form-data'
              setForm(prev => ({ ...prev, thumbna
} catch (err) {
    setError('Failed to upload image')
} finally {
    setUploading(false)
       const handleSubmit = async (e: React.FormEvent) => {
   e.preventDefault()
                        await axios.post('/events', {form}, {
    headers: {
        Authorization: `Bearer ${token}`
                router.push('/panel/events')
} catch (err: any) {
   setError(err.response?.data?.message)
```

Coba kita test membuat event, isikan seperti di gambar. Untuk thumbnail, kita kita memilih gambar, maka gambar akan langsung di upload ke backend, dan path lokasi nya akan di simpan ke state form nya.

Jika berhasil, tampilannya akan seperti ini di list table.
